Semiconductor Sector Outlook 2025

Goldman Sachs Research | Technology Sector | May 2025

EXECUTIVE SUMMARY

The semiconductor sector is poised for a strong recovery in 2025, driven primarily by artificial intelligence chip demand. We maintain a BUY rating on the sector with a 12-month price target implying 18% upside from current levels.

KEY FINDINGS

AI Chip Demand Surge

- Data center GPU demand is expected to grow 45% YoY in 2025
- NVIDIA maintains dominant 80% market share in AI training chips
- AMD gaining ground with MI300X, capturing 12% of AI inference market
- Custom silicon (Google TPU, AWS Trainium) growing but limited to internal use

Memory Recovery

- DRAM prices recovering after 18-month downturn, up 23% QoQ in Q1 2025
- HBM (High Bandwidth Memory) for AI applications at premium pricing
- Samsung and SK Hynix benefiting from tight HBM supply

Inventory Correction Complete

- PC and smartphone inventory normalization complete as of Q4 2024
- Consumer electronics demand stabilizing at pre-pandemic levels
- Enterprise storage demand recovering with cloud capex expansion

RISKS

- Geopolitical risk: US-China chip export restrictions could impact TSMC revenue by 8-12%
- Cyclicality: Semiconductor stocks historically volatile with 40-60% drawdowns in downturns
- Competition: Intel foundry ambitions could disrupt TSMC's dominance by 2027

TOP PICKS

1. NVIDIA (NVDA) - BUY, Target $950 - AI chip dominance, data center growth
2. TSMC (TSM) - BUY, Target $180 - Foundry monopoly, pricing power
3. Broadcom (AVGO) - BUY, Target $1,400 - Custom AI silicon, networking chips
4. Micron (MU) - BUY, Target $130 - HBM beneficiary, DRAM recovery

VALUATION

Sector trades at 28x forward P/E vs 5-year average of 22x, justified by AI growth premium.
Fair value estimate implies 15-20% upside for quality names over 12 months.

CONCLUSION

We recommend overweighting semiconductors in technology portfolios. Focus on AI infrastructure plays (NVIDIA, Broadcom) and memory recovery stories (Micron).
Avoid legacy industrial semiconductor exposure until capex cycle recovers in H2 2025.
